MIS Bone Preservation Fastener Technology

*The Principles of Minimally Invasive Surgery (MIS)
Applied to Bone*

Improving & Accelerating the Patient's Path to Recovery

OsteoCentric Technologies continues to redefine minimally invasive surgical technology across all Orthopedic market segments by moving beyond incremental improvements and addressing the root cause of delayed patient recovery. UnifiMI MIS Bone Preservation Fastener & Tapping Technology is capable of preserving the bone, instantly interlocking to the preserved bone, and sharing energy with the preserved bone.

First there was **Osseointegration** For Secondary Stability

A pivotal breakthrough in medical technology uncovering Titanium's ability to integrate with bone allowing for time-dependent biological implant stability.

Now there's **Mechanical Integration** For Immediate & Sustained Primary Stability

Following in the footsteps of Osseointegration, **UnifiMI** - MIS bone preserving interface technology creates an immediate structural and functional connection that provides sustained primary implant stability.

Inherent Clinical Challenges

Bone Damage. Insufficient Fixation.

Implant Instability & Loosening. Delayed Patient Recovery

Implant fixation has its limitations and still poses¹ a relevant clinical problem within the Orthopedic industry due to the inherent challenges of bone damage during implant insertion², insufficient fixation and instability that can lead to implant loosening³.

Advanced Particle Based Simulation

Simulates complex bone structure subjected to high compression and crushing deformations resulting in micro bone fragments.

Damaged Bone Architecture

Implant Stability Dip at a Glance

Stability Dip - Legacy Compression-Based Interface

Time 0 Primary Implant Stability Established

Weeks 1 - 4/5 Primary Implant Stability Decreases

Weeks 5+ Secondary Implant Stability Increases

Sustained Stability* - UnifiMI/ Mechanical Integration

Time 0+ Primary Implant Stability Established & Sustained Over Time

**Anticipated Stability Projection*

Most Orthopedic Implants Are Impacted By And Experience a Similar Stability Response During The Recovery Phase

Dentists discovered the stability dip because they are able to monitor and measure implant stability during patient follow up. Whereas compared to an orthopedic procedure, post-operative access to the implant is not possible. Monitoring stability and determining when the implant is capable of bearing loads is considered a critical factor in the short and long-term success of the implant.

The Dip in Implant Stability

The dip in implant stability is due to the structural and biologic response to bone damage that occurs during implant insertion² which dramatically affects implant stability and limits the bone's ability to bear functional loads while it reconstitutes.

Skip The Dip: Optimize & Accelerate Recovery

Accelerate the patient's healing journey by addressing and confronting the root causes that can lead to delayed recovery by:

Preserving the bone

Instantly interlocking
to the preserved bone

Sharing energy
with the preserved bone

Mechanical Integration Technology

Unique thread geometry instantly and circumferentially interlocks with bone by entrapping and containing bone between the thread form.

Mechanical Integration creates a structural and functional connection between an implant and bone which transfers and shares loads in a similar manner to biological integration (Osseointegration).

UnifiMI is supported by 10 years of advanced research and development. No other Dental System on the market is equipped with advanced UnifiMI technology.

Integrated Bone

UnifiMI® MIS Bone Preservation Fastener & Tapping Technology

UnifiMI utilizes proprietary tapping technology that prepares and preserves the structural integrity of bone by advancing bone chips forward, creating a pristine pathway for implant insertion.

UnifiMI was designed to provide advantages in both short and long-term response to mechanical stress creating a platform for optimal recovery and long-term success. The incremental and gradual bone removal process preserves the substrate and helps to establish a stable implant-to-bone interface, which is known to play major role in improving implant fixation and prolonging stability.

Bone Architecture Preservation

UnifiMI Interface

- Cleanly Prepares & Preserves During Insertion
- Creates a Stable Mechanically Integrated Interface

Bone Architecture Damage

Legacy Interface

- Crushes & plows during insertion
- Creates a damaged & unstable interface

MIS Bone Preservation Tapping Technology & Instant Interlocking Thread-form

UnifiMI, the new standard and clinically proven platform technology that utilizes the principles of MIS bone preservation and mechanical integration to address the challenges associated with implant survivorship and patient outcomes by:

Preserving the architecture of the patient's bone during implant insertion

Sustaining primary implant stability over time

Leveraging MIS technology to accelerate the patient's healing journey

100+

Elite Level 1 Trauma

Technology

7+

Years of Proven
Performance

Backed by over 9 years of R&D, and More Than \$200 Million
Invested in Advanced Biomechanical Testing & Clinical Evaluation

A New Era in Orthopedics

OsteoCentric Technologies is leading an industry-wide, global revolution to address the systemic issue of bone damage, compromised implant stability and loosening by developing new, minimally invasive techniques, instruments, and implants that go beyond soft tissues and focuses on preparing and preserving bone.

Trusted & Adopted in:

- SI Joint Fusion
- Spine
- Trauma
- Sports Medicine
- Extremities
- Dental
- Oncology & Bone Anchored Prostheses

Surgeons Finally Have a Choice

Discover the MIS bone preservation solution that elite surgeons in world-renowned institutions have rapidly adopted and trust to help accelerate the patient's healing journey.

Advancements in Technology

UnifiMI® Fastener Technology was developed & engineered to meet the highest quality standards of the medical device industry and is being optimized for non-medical multi-use applications.

Aerospace & Defense

UnifiMI Platform Technology
Applications are Endless

Transportation

Sporting Goods

Oil & Gas

Construction

Automotive

Agriculture

Non-medical market segments developed advanced interfaces technologies to achieve mechanical stability while considering different material types and environmental conditions. Substrate preservation and interlocking for off-axis load resistance is critical for initial and sustained long-term stability. UnifiMI is redefining the performance capabilities of fastener technologies by developing innovative next-gen solutions and fueling collaborative partnerships with industry leaders.
